Midterm Examination #2

Mth 136 = Sta 114

Monday, April 16, 2009
2:50 – 4:05 pm
Version *b*

- This is a **closed book** exam— put your books on the floor.
- You may use a calculator and **one page** of your own notes.
- Do not share calculators or notes.
- **Show** your **work**. Neatness counts. Boxing answers helps.
- Numerical answers: **four significant digits** or simplified exact solution (e.g., fractions **in lowest terms**). **Simplify** *all* answers for full credit.
- Extra worksheet and pdf & distribution tables are attached.

Cheating on exams is a breach of trust with classmates and faculty that will not be tolerated. After completing the exam please acknowledge that you have adhered to the Duke Community Standard:

- I will not lie, cheat, or steal in my academic endeavors;
- I will conduct myself honorably in all my endeavors; and
- I will act if the Standard is compromised.

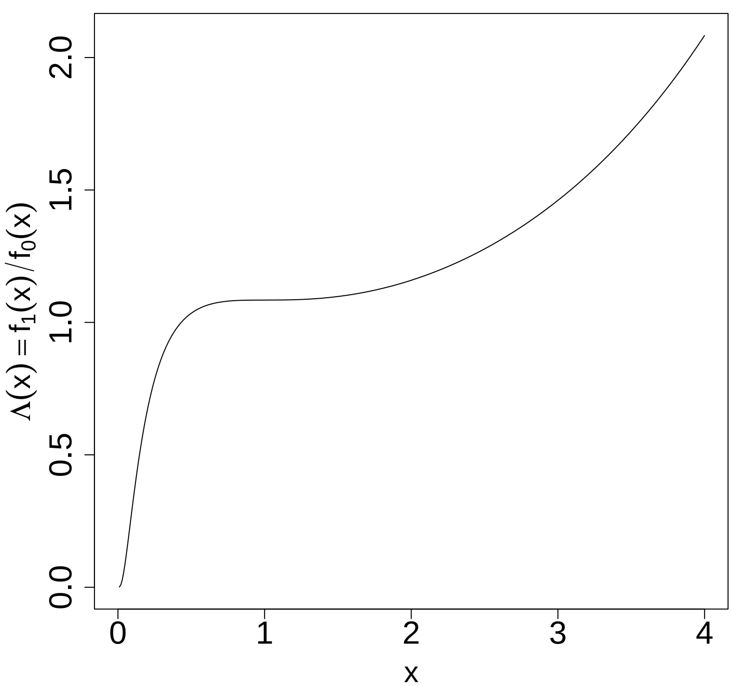
Problem 1: Skyler thinks X has a standard exponential distribution with density funcition

$$f_0(x) = e^{-x}\mathbf{1}_{\{x>0\}},$$

while Terry thinks it has a lognormal distribution (so $Y \equiv \log X$ has a standard Normal distribution $Y \sim \mathsf{No}(0,1)$, $X = e^Y$) with density function

$$f_1(x) = \frac{1}{x\sqrt{2\pi}} e^{-(\log x)^2/2}\mathbf{1}_{\{x>0\}}.$$

When they disagree about things, Skyler is right about 2/3 of the time. Here's a plot of the likelihood ratio against H_0, $\Lambda(x) = f_1(x)/f_0(x)$, vs. x:



Problem 1 (cont):

a) (6) Prove that the likelihood ratio increases monotonically on all of $0 < x < \infty$.

b) (6) Based on the information above and the single observation $X = 3$, what is the (posterior) probability that Skyler was right? Give answer to four significant digits (or exact answer), and **simplify**:

$\mathsf{P}[\text{ Skyler correct } \mid X = 3] =$

Problem 1 (cont):

c) (6) Find the P-value for likelihood ratio test of $H_0: \ X \sim f_0(x)$ against alternative $H_1: \ X \sim f_1(x)$ for the single observation $X = 3$ (as usual, exact or 4 sig digs:

$P =$

c) (1) Would you Accept or Reject H_0 at level $\alpha = 0.05$?

d) (1) Is the test in c) above UMP? Circle one: Y N
Why or why not?

Problem 2: The $n = 9$ independent random variables $\{X_i\}_{i \le n}$ are a simple random sample from the Normal distribution $X_i \sim \mathsf{No}(\mu, \sigma^2)$, with variance σ^2 and mean μ.

a) (7) With σ^2 unknown, describe the Rejection Region $\mathcal{R}$ for a two-sided test of size $\alpha = 0.05$ of the hypothesis

$$H_0 : \ \mu = 17.5 \qquad vs. \qquad H_1 : \ \mu \neq 17.5$$

Reject H_0 if:

b) (7) Same question, if variance of $\{X_i\}$ is known to be $\sigma^2 = 16$:

Reject H_0 if:

c) (6) What is the *power* $\pi(\mu)$ of the test in part b) above, for $\mu = 20$?

$\pi(20) =$ ______________

Problem 3: Once again the $n = 9$ independent random variables $\{X_i\}_{i\le n}$ are a simple random sample from the Normal distribution $X_i \sim \mathsf{No}(\mu, \sigma^2)$, with variance σ^2 and mean μ, but now we have some data. The values of a few statistics from this random sample are:

$$S(\mathbf{x}) = \sum_{i\le n} X_i = 180 \qquad T(\mathbf{x}) = \min_{i\le n} X_i = 1$$
$$V(\mathbf{x}) = \sum_{i\le n} (X_i - \bar{X})^2 = 72 \qquad W(\mathbf{x}) = \text{Median}(\{X_i\}) = 24$$

a) (7) With σ^2 unknown, give the P-value for a two-sided test of the hypothesis

$$H_0:\ \mu = 17.5 \qquad vs. \qquad H_1:\ \mu \neq 17.5$$

$P =$

b) (7) Same question, if variance of $\{X_i\}$ is known to be $\sigma^2 = 16$:

$P =$

c) (6) Are these answers consistent with your answers to parts a) and b) of Problem 2? Y N Explain.

Problem 4: For some parameter value $0 < \theta < \infty$, the three random variables $\{X_i\}_{1 \le i \le 3}$ are uniformly distributed on the interval $[0, \theta]$. A few statistics from this random sample to consider are:

$$S(\mathbf{x}) = \sum X_i \quad T(\mathbf{x}) = \sum (X_i - \bar{X})^2 \quad V(\mathbf{x}) = \min X_i \quad W(\mathbf{x}) = \max X_i$$

a) (6) If θ is known to be one of $\{\theta_0 = 2,\ \theta_1 = 3\}$, with prior probabilities $\xi_0 = 0.8$ and $\xi_1 = 0.2$ respectively, find the posterior probability indicated, as a function of one or more of S, T, V, W. Simplify!

$\xi(\theta = \theta_0 \mid \mathbf{x}) =$

b) (6) If (instead) θ might be any number in $[1, \infty)$, with a Pareto prior distribution $\theta \sim \mathsf{Pa}(\alpha, \epsilon)$ with density function

$$\xi(\theta) = \alpha \epsilon^\alpha / \theta^{\alpha+1} \mathbf{1}_{\{\theta \ge \epsilon\}}$$

with $\alpha = 1$ and $\epsilon = 1$, find the posterior density function for θ, correctly for all $\theta \in \mathbb{R}$. If possible, give your answer using one or more of S, T, V, W. Simplify!

$\xi(\theta \mid \mathbf{x}) =$

Problem 4 (cont):

c) (8) Now suppose we observe data $\mathbf{x} = \{0.60, 1.75, 1.25\}$ and we wish to make a decision about the hypothesis $H_0 : \ \theta \le 2$ with alternative $H_1 : \ \theta > 2$, using the Pareto prior from b) above. If we lose \$1 for choosing H_0 when in fact H_1 is true, and we lose \$$w$ for choosing H_1 when in fact H_0 is true, what decision $\delta(\mathbf{x})$ (= 0 or 1) should we make to minimize our expected loss? This may depend on w, of course... Show your work.

$\delta(\mathbf{x}) =$

Problem 5: Part (a) of this problem is completely unrelated to parts (b) and (c).

a) (10) In a famous experiment, Gregor Mendel observed the shape and color of peas that resulted from certain crossbreedings. The reported results of one such experiment were:

round yellow	315	wrinkled yellow	101
round green	108	wrinkled green	32

According to his theory, the frequencies of these four classifications should be in the ratio 9 : 3 : 3 : 1. What do you conclude from a χ^2 test? Please give the value "χ^2" of the test statistic (called "Q" by DeGroot) used for χ^2 tests, its number of degrees of freedom "d.f.", and the P-value for the hypothesis that Mendel's theory is correct, "P."

$\chi^2 =$ ______________ d.f. = ______________ $P =$ ______________

Problem 5 (cont):

b) (5) The 10 random variables $\{X_i\}$ are independent and take nonnegative integer values. Describe how you would use a generalized likelihood ratio test (GLRT) to test the hypothesis H_0 that these come from a Poisson distribution with mean $\lambda = 3$ against the composite alternative H_1 that they come from a Poisson distribution with some other (unspecified) mean. What statistics would you need from the data? Give a test statistic $T(\mathbf{x})$ such that your recommended test would reject H_0 for large values of T.

$$\begin{aligned} H_0: &\ \{X_i\}_{i\le n} \sim \mathsf{Po}(\lambda) \quad \text{for } \lambda = 3 \quad vs. \\ H_1: &\ \{X_i\}_{i\le n} \sim \mathsf{Po}(\lambda) \quad \text{for } \lambda \neq 3. \end{aligned}$$

(xc) Find the approximate probability distribution of T, if H_0 is true:

Problem 5 (cont):

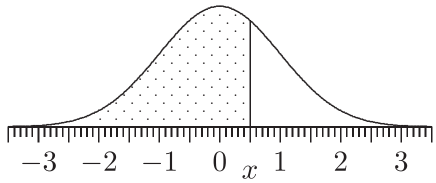
c) (5) The 10 random variables $\{X_i\}$ are (still) independent and take nonnegative integer values. Describe how you would use a GLRT to test the hypothesis H_0 that $\{X_i\}$ come from a Poisson distribution (with unspecified mean λ) against the alternative H_1 that they come from a Binomial distribution with $n = 5$ (but p unspecified):

$$\begin{aligned} H_0 &: \ \{X_i\}_{i\le n} \sim \mathsf{Po}(\lambda) \quad \text{for some } \lambda \in [0,\infty) \quad \textit{vs.} \\ H_1 &: \ \{X_i\}_{i\le n} \sim \mathsf{Bi}(5,p) \quad \text{for some } p \in [0,1] \end{aligned}$$

What statistics would you need from the data? Give a test statistic $T(\mathbf{x})$ such that your recommended test would reject H_0 for large values of T.

Extra worksheet, if needed:

$$\Phi(x) = \int_{-\infty}^{x} \frac{1}{\sqrt{2\pi}} e^{-z^2/2}\, dz:$$



Area $\Phi(x)$ under the Standard Normal Curve to the left of x.

Name	Notation	pdf/pmf	Range	Mean μ	Variance σ^2	
Beta	$\mathsf{Be}(\alpha,\beta)$	$f(x)=\frac{\Gamma(\alpha+\beta)}{\Gamma(\alpha)\Gamma(\beta)}x^{\alpha-1}(1-x)^{\beta-1}$	$x\in(0,1)$	$\frac{\alpha}{\alpha+\beta}$	$\frac{\alpha\beta}{(\alpha+\beta)^2(\alpha+\beta+1)}$	
Binomial	$\mathsf{Bi}(n,p)$	$f(x)=\binom{n}{x}p^x q^{(n-x)}$	$x\in 0,\cdots,n$	$n\,p$	$n\,p\,q$	$(q=1-p)$
Exponential	$\mathsf{Ex}(\lambda)$	$f(x)=\lambda\,e^{-\lambda x}$	$x\in\mathbb{R}_+$	$1/\lambda$	$1/\lambda^2$	
Gamma	$\mathsf{Ga}(\alpha,\lambda)$	$f(x)=\frac{\lambda^\alpha}{\Gamma(\alpha)}x^{\alpha-1}\,e^{-\lambda x}$	$x\in\mathbb{R}_+$	α/λ	α/λ^2	
Geometric	$\mathsf{Ge}(p)$	$f(x)=p\,q^x$	$x\in\mathbb{Z}_+$	q/p	q/p^2	$(q=1-p)$
		$f(y)=p\,q^{y-1}$	$y\in\{1,...\}$	$1/p$	q/p^2	$(y=x+1)$
HyperGeo.	$\mathsf{HG}(n,A,B)$	$f(x)=\frac{\binom{A}{x}\binom{B}{n-x}}{\binom{A+B}{n}}$	$x\in 0,\cdots,n$	$n\,P$	$n\,P\,(1-P)\frac{N-n}{N-1}$	$(P=\frac{A}{A+B})$
Logistic	$\mathsf{Lo}(\mu,\beta)$	$f(x)=\frac{e^{-(x-\mu)/\beta}}{\beta[1+e^{-(x-\mu)/\beta}]^2}$	$x\in\mathbb{R}$	μ	$\pi^2\beta^2/3$	
Log Normal	$\mathsf{LN}(\mu,\sigma^2)$	$f(x)=\frac{1}{x\sqrt{2\pi\sigma^2}}e^{-(\log x-\mu)^2/2\sigma^2}$	$x\in\mathbb{R}_+$	$e^{\mu+\sigma^2/2}$	$e^{2\mu+\sigma^2}\left(e^{\sigma^2}-1\right)$	
Neg. Binom.	$\mathsf{NB}(\alpha,p)$	$f(x)=\binom{x+\alpha-1}{x}p^\alpha\,q^x$	$x\in\mathbb{Z}_+$	$\alpha q/p$	$\alpha q/p^2$	$(q=1-p)$
		$f(y)=\binom{y-1}{y-\alpha}p^\alpha\,q^{y-\alpha}$	$y\in\{\alpha,...\}$	α/p	$\alpha q/p^2$	$(y=x+\alpha)$
Normal	$\mathsf{No}(\mu,\sigma^2)$	$f(x)=\frac{1}{\sqrt{2\pi\sigma^2}}e^{-(x-\mu)^2/2\sigma^2}$	$x\in\mathbb{R}$	μ	σ^2	
Pareto	$\mathsf{Pa}(\alpha,\epsilon)$	$f(x)=\alpha\,\epsilon^\alpha/x^{\alpha+1}$	$x\in(\epsilon,\infty)$	$\frac{\epsilon\,\alpha}{\alpha-1}$	$\frac{\epsilon^2\alpha}{(\alpha-1)^2(\alpha-2)}$	
Poisson	$\mathsf{Po}(\lambda)$	$f(x)=\frac{\lambda^x}{x!}e^{-\lambda}$	$x\in\mathbb{Z}_+$	λ	λ	
Snedecor F	$F(\nu_1,\nu_2)$	$f(x)=\frac{\Gamma(\frac{\nu_1+\nu_2}{2})(\nu_1/\nu_2)^{\nu_1/2}}{\Gamma(\frac{\nu_1}{2})\Gamma(\frac{\nu_2}{2})}\times x^{\frac{\nu_1-2}{2}}\left[1+\frac{\nu_1}{\nu_2}x\right]^{-\frac{\nu_1+\nu_2}{2}}$	$x\in\mathbb{R}_+$	$\frac{\nu_2}{\nu_2-2}$	$\left(\frac{\nu_2}{\nu_2-2}\right)^2\frac{2(\nu_1+\nu_2-2)}{\nu_1(\nu_2-4)}$	
Student t	t_ν	$f(x)=\frac{\Gamma(\frac{\nu+1}{2})}{\Gamma(\frac{\nu}{2})\sqrt{\pi\nu}}[1+x^2/\nu]^{-(\nu+1)/2}$	$x\in\mathbb{R}$	0	$\nu/(\nu-2)$	
Uniform	$\mathsf{Un}(a,b)$	$f(x)=\frac{1}{b-a}$	$x\in(a,b)$	$\frac{a+b}{2}$	$\frac{(b-a)^2}{12}$	
Weibull	$\mathsf{We}(\alpha,\beta)$	$f(x)=\alpha\beta\,x^{\alpha-1}\,e^{-\beta\,x^\alpha}$	$x\in\mathbb{R}_+$	$\frac{\Gamma(1+\alpha^{-1})}{\beta^{1/\alpha}}$	$\frac{\Gamma(1+2/\alpha)-\Gamma^2(1+1/\alpha)}{\beta^{2/\alpha}}$
